

AMA Exit and Birth Year Data Cleaning Report

May Be Shared

Tate Martin and Herschel Hoffeditz

Augusta Military Academy was open over 110 years and educated over 12000 young men. In our report we anonymized the last names and kept the rest of the data original. We wanted to ask the question of how old each cadet was when they left the academy for graduation or other reasons. To answer this question we had to clean both the Birth Year of the cadet as well as the year they left the academy.

Exit Age of School

The dataset featured five columns, a name column which was anonymized for us, an exit year column, an other year column which sometimes held the exit year and was sometimes blank, an ID number column with a unique number for each cadet, and a column that held birth and exit years as well as locations all in one. The exit year column was cleaned to have each year be a 4 digit year. Many of the entries were 2 digits, but these all appeared to be from the 1900s as they are before the decade the academy was opened. A 19 was added on to the beginning of each of these 2 digit numbers. The birth and death column was cleaned to remove all other numbers and words and just leave a 4 digit birth year. Blank entries or entries with no birth year were removed. Birth was signified in a few different ways like "DOB:" and "Born:".

After looking at the results of the cleaning and compiling exit ages, it looks like very few cadets are exiting the academy before their teenage years, and the most frequent exit age is around 17 or 18. We conclude that the academy is more of a modern day high school than a college.
